

The Summary Plugin

The Summary Plugin allows the user to add a **summary** to blog entries. This **summary** can be used to create a 'Read More' option for entries.

Code

The SummaryPlugin.zip contains the following files:

- a. plugins/src/org/blojsom/plugin/common/SummaryPlugin.java
- b. plugins/src/org/blojsom/plugin/common/templates/admin-summary.vm

Changes to configuration files

- a. In plugins/src/org/blojsom/plugin/admin/resources/messages.properties the following text must be added -

```
#
#SummaryPlugin
#
summary.text=Summary
```

- b. In file WEB-INF/classes/blojsom-plugins.xml following entry should be added

```
<bean id="entry-summary" class="org.blojsom.plugin.common.SummaryPlugin" init-method="init"
destroy-method="destroy">
  <property name="servletConfig">
    <ref bean="servletConfigFactoryBean"/>
  </property>
  <property name="eventBroadcaster">
    <ref bean="eventBroadcaster"/>
  </property>
  <property name="blojsomProperties">
    <ref bean="defaultProperties"/>
  </property>
</bean>
```

- c. Next, in the same file, an entry must be made for the **Summary Plugin** to ensure that it is activated, by editing the following entry to add "entry-summary" to the 'default' and 'html' flavors, as shown:

```
<property name="defaultPluginProperties">
  <map>
    <entry key="admin" value="admin"/>
    <entry key="atom" value=""/>
    <entry key="default" value="conditional-get, meta, limiter, nofollow, rss-enclosure, entry-
summary"/>
    <entry key="html" value="meta, tag-cloud, date-format, referer-log, calendar-gui, calendar-filter,
comment, trackback, simple-search, limiter, emoticons, macro-expansion, days-since-posted, word-count,
simple-obfuscation, nofollow, rss-enclosure, entry-summary, technorati-tags"/>
    <entry key="rdf" value=""/>
    <entry key="rsd" value=""/>
    <entry key="rss" value=""/>
    <entry key="rss2" value=""/>
  </map>
</property>
```

- d. Add the following in ocean-entry (or whatever the equivalent is in your template that displays the Entries)

```
#{if($entry.getMetaData() && $entry.getMetaData().get("summary"))
<strong>| Summary:</strong> $entry.getMetaData().get("summary")
#end
```
